                                                                                                                               The present sequence is that of orb-weaver spider (Nephila clavipes)
recombinant silk protein pET((SP1)4/(SP2)1)4. The invention
recombinant silk protein pET((SP1)4/(SP2)1)4. The invention
provides methods for purifying and spinning spider silks and other
structural proteins. Organic acids are used to lyse recombinant;
cells or other biological samples (such as non-recombinant)
cells or other biological samples (such as non-recombinant)
the structural proteins intact. In the case of silk proteins, the
proteins by hydrolysing many of the macromolecules while leaving
the structural proteins intact. In the case of silk proteins, the
cresulting lysate is further purified by ion-exchange or affinity
chromatography and processed into an aqueous-based mixture for
tibre spinning. In the present case, the pET((SP1)4/(SP2)1)4 gene
that condition westor pET34 for recombinant expression in
Escherichia coil, and recombinant silk protein was obtained in
T5-75% purity using propionic acid and anhon-exchange chromatography
to the propionic acid, the recombinant protein was obtained in 80%
purity. Products obtained using the methods of the invention can
to the propionic acid, the recombinant protein was obtained in 80%
purity. Products obtained using the methods of the invention can
to the propionic acid, the recombinant protein was obtained and
parachute cords. The new method has the following advantages
cover prior art: it involves fewer steps, requires less time and
smaller volumes of reagents, results in better recovery of protein
at higher purity (70-99%), is easy to scale up, and the fibres are
spen in an environmentally benign solution reducing hazardous waste
Recovering structural polypeptides in a biological sample, useful for purifying and spinning spider silks and other structural proteins, comprises treating the sample containing the polypeptides with an acid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 480

The present sequence is that of orb-weaver spider (Nephila clavipes) recombinant silk protein pOE((SP1)4/(SP2)1)4. The invention provides methods for purifying and spinning spider silks and other structural proteins. Organic acids are used to lyse recombinant calls or other biological samples (such as non-recombinantly proteins by hydrolysing many of the macromolecules while leaving the structural proteins intact. In the case of silk proteins, the resulting lysate is further purified by lon-exchange or affinity chromatography and processed into an aqueous-based mixture for fibre spinning. In the present case, the pOE((SP1)4/(SP2)1)4 gene was cloned into vector pOE-9 for recombinant expression in Escherichia coli, and recombinant silk protein was obtained in 97% purity using propionic acid and anion-exchange chromatography on CAE-Sephadex A50. Products obtained using the methods of the invention can be used in the construction of many materials including films, fibres, woven articles, sutures, ballistic protection, parachutes and parachute cords. The new method has
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Recovering structural polypeptides in a biological sample, useful for purifying and spinning spider silks and other structural proteins, comprises treating the sample containing the polypeptides with an acid

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonuclectides, each oligonuclectide encoding a repeating unit of a spidroin protein ripe synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (1) as adhesion surfaces for culturing cells; and (11) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Also they retain water solubility after long-term boiling in aqueous colutions and since they are also soluble in organic solvents but proteinted at high salt concentration, they are easily extracted and purified. The modular construction of the invention facilitates uncorporation of additional peptide-encoding sequences, e.g. to simplify the synthetic N. clavipes spidroin-1 homologue SOISOI described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              34;

This invention describes a novel DNA sequence, encoding a synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidonin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and (iii) as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity).

Constitutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and concipitated at high salt concentration, they are easily extracted and concorporation of additional peptide-encoding sequences, e.g. to simplify purification or modulate solubility. This sequence represents the content of construction of the invention described in the content of the invention of 
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      34;

This invention describes a novel DNA sequence, encoding synthetic spider silk protein, comprising modules, each comprising a group of sequentially arranged oligonucleotides encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and artificial organs; (ii) as adhesion surfaces for culturing cells; and cilis as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and clasticity).

Also they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and incorporation of additional peptide-encoding sequences, e.g. to simplify thrifted in organic represents the concentration or modulate solubility. This sequence represents the synthetic N. clavipes spidroin-1 homologue SOISM12 described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        35;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               116 AGRGGQGAGAAAAAGGAGQGGYGGLGSQG-AGRGGLGGGGGAC----AAAAAAAGGAGGGG 170

P is a promoter for driving the expression of an SLP transgene and T is a protein in the method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, blomaterial construction, such as rope, surgical sutures, blomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dragline protein (DP) I synthetic variant DPIB/his tag 16mer (i.e. 16 copies of DPIB with a His tag at the C-terminus) which is used as an SLP construct in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                1166

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant containing an SLP expression cassetter. The green plant contains the expression cassetter P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, flexible its downs for certain electrical components, or as a biomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dagline protein (DP) I synthetic variant DPLB Ismer (i.e. 16 copies of DPLB) which is used as an SLP construct in the method of the invention.
                                                                                                                                                                                                                                                                                            Orb-weaving spider; silk-like protein; SLP; transgenic plant; prometer; 5' terminator; fabric production; material construction; rope; surgical suture; flexible tie down; electrical component; implantation; Dragline protein 1; DP-1B 16mer.
             Producing silk-like proteins in a green plant, useful in fabrics and material construction, comprises providing a silk-like protein

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant containing an SLP expression cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, flexible tie downs for certain electrical components, or as a biomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dragline protein (DP) I synthetic variant DPIB/his tag Merc (i.e. 8 copies of DPIB with a His tag at the C-terminus) which is used as an SLP construct in the method of the

                                                                                                                                                                                                                 34;
                                    in a green plant by providing a green plant containing an SIP expression cassette. The green plant contains the expression cassette P-SIP-T where p is a prometer for driving the expression of an SIP transgene and T is a 5' terminator. The method is useful for producing silks and silk-like proteins in green plants. The silks and silk-like proteins may be used in flabiles or in material construction, such as rope, surgical sutures, blomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is the silk protein Dragline protein (DP) I synthetic variant DPIB Bmer (i.e. 8 copies of DPIB) which is used as an SIP construct in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       398

squentially arranged oligonucleotides, each comprising a group of a sequentially arranged oligonucleotides, each comprising a group of a sequentially arranged oligonucleotides, each oligonucleotide encoding a repeating unit of a spidroin protein. The synthetic protein has at least 84% homology with the Nephila clavipes spidroin protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) for medical use, especially to close wounds and/or to support or cover attifictal organs; (11) as adhesion surfaces for culturing cells; and cilii as filters. The synthetic proteins are very similar to native spider silk proteins; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity). Chiso they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high sait concentration, they are easily extracted and purified. The modular construction of the invention facilitates in concentration or additional peptide-encoding sequences, e.g. to simplify purification or modulate solubility. This sequence represents the synthetic N. clavibes spidroin-1 homologue Sol described in the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          32;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              New DNA encoding synthetic spider silk protein, useful e.g. for closing wounds, comprises modules that encode repeating units of spidroin
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Gaps
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                This invention describes a novel DNA sequence, encoding a synthetic

spider all protein, comprising and addition as a sequencially a synthetic speak are accomplished, each comprising a synthetic sequentially arranged oilgonucleotides, each oilgonucleotide encoding a repeating unit of a spidonucleotide, each oilgonucleotide encoding a repeating unit of a spidonucleotide, each oilgonucleotide encoding a repeating unit of a spidonucleotide. The synthetic protein and is used to produce synthetic fibres, films and/or membranes, particularly: (1) con medical use, especially to close wounds and/or to support or cover artificial organs; (ii) as adhesion surfaces for culturing cells; and artificial organs; (ii) as adhesion surfaces for culturing cells; and stifficial organs; can be prepared on a large scale and can be spun to fibres with excellent mechanical properties (strength and elasticity).

Also they retain water solubility after long-term boiling in aqueous solutions and since they are also soluble in organic solvents but precipitated at high salt concentration, they are easily extracted and precipitated at high salt concentration, they are easily extracted and composed of the Lebd signal peptide encoding sequences, e.g. to simplify purification or modulate solubility. This sequences represents a construct composed of the Lebd signal peptide, N. clavipes spidroin-I synthetic homologue SOl, a c-Myc-tag and an endoplasmic reticulum (ER)-retention signal described in the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         32;

Nephila clavipes; silk protein; tandem repeat; fibre; dragline; tensile strength; elasticity.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present sequence represents a spider silk protein from the present invention. Spider silk proteins, and peptide fragments within the proteins, can be produced and purified independently and can then be mixed and made into fibres that have higher tensile strengths and

Cosmetic or dermatological composition containing spider silk protein, for hair or skin care, in make-up or sunscreens
                      The present sequence represents the natural spider silk protein spidroine major 1. The protein improves the moisturizing/softening action of the compositions. The protein, and its fragments are used in cosmetic or dermatological compositions. These compositions have use as hair or skin care products; and make-up or sunscreens. As the protein is a good, persistent film-formers on the skin of low surface density, it can be used for delivery of active agents that are generally difficult to administer, e.g. vitamins, hormones, moisturizers or agents for treating disorders of the

                                                                                                                                                                                                                                                                                                                                                                                                                                                                       proteins. The spider silk proteins are characterized by repeting alpha and beta regions and optional variable regions. The DNA sequences are useful in the production of spider silk protein by recombinant DNA techniques. The recombinant place silk proteins may be used for the production of fibers. The present sequence represents the spider silk protein 1, derived from the major ampullate gland of Nephila clavipes.

The invention relates to a method of producing silk-like proteins (SLP) in a green plant by providing a green plant containing an SLP expression cassette. The green plant contains the expression cassette P-SLP-T where P is a promoter for driving the expression of an SLP transgene and T is a 5' terminator. The method is useful for producing sliks and slik-like proteins in green plants. The silks and silk-like proteins may be used in fabrics or in material construction, such as rope, surgical sutures, flexible tie downs for certain electrical components, or as a biomaterial for implantation. The method allows for more cost effective production of silk not obtained from natural or microbial sources. The present sequence is orb-weaving spider spidroinl, a natural silk protein whose sequence is used as the basis for the SLP proteins used in the method of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                            34,
